

<p><b>Class Notes</b> <i>Principles of Genetics,</i> <i>part 1</i> <b>Questions/Main Idea:</b></p>	<p>Name: _____ Period: _____ Date: _____</p> <p style="text-align: center;"><b>Notes:</b></p>
<p>Gregor Mendel (1822-1884)</p> 	<ul style="list-style-type: none"> <li>• German monk born in 1822</li> <li>• Lived in what is now the Czech Republic</li> <li>• Tended the garden at his monastery, conducted experiments with pea plants</li> <li>• Studied peas for 7 years, published results 1866; ignored until 1900</li> <li>• Now considered the “Father of Genetics”</li> </ul>
<p>What is a <b>trait</b>?</p>	<ul style="list-style-type: none"> <li>• A trait is a characteristic that can vary from one individual to the next (e.g., eye color)</li> <li>• Mendel chose 7 pea plant traits to study: <ul style="list-style-type: none"> <li>○ seed shape, seed color, flower color, pod shape, pod color, flower position, plant height</li> </ul> </li> <li>• He was lucky that each trait happened to be located on different chromosomes (people didn’t know about chromosomes back then)</li> </ul>
<p>Mendel's experiments</p> 	<ul style="list-style-type: none"> <li>• First, he created <b>true (pure) breeding</b> pea plants</li> <li>• Then he experimented with different traits (one at a time)</li> <li>• He <b>cross-pollinated</b> plants with different traits, and observed the offspring</li> </ul>
<p>What is <b>true (pure) breeding</b>?</p>	<ul style="list-style-type: none"> <li>• <b>True (pure) breeding</b> = offspring always have same trait as parent (every time, no matter what!)</li> </ul>
<p>What is <b>self-pollination</b>?</p>	<ul style="list-style-type: none"> <li>• <b>Self-pollination</b> = plant fertilizes itself</li> </ul>
<p>What is <b>cross-pollination</b>?</p>	<ul style="list-style-type: none"> <li>• <b>Cross-pollination</b> = one plant fertilizes another</li> </ul>
<p>What is the <b>P generation</b>?</p>	<ul style="list-style-type: none"> <li>• <b>P generation</b> = Parent generation</li> </ul>
<p>What is the <b>F<sub>1</sub> generation</b>?</p>	<ul style="list-style-type: none"> <li>• <b>F<sub>1</sub> generation</b> = 1st generation offspring (“filius” is Latin for “son”; offspring of P generation)</li> </ul>
<p>What is the <b>F<sub>2</sub> generation</b>?</p>	<ul style="list-style-type: none"> <li>• <b>F<sub>2</sub> generation</b> = 2nd generation offspring (offspring of F<sub>1</sub> generation)</li> </ul>
<p>What were the results of Mendel’s P generation crosses?</p>	<ul style="list-style-type: none"> <li>• The F<sub>1</sub> generation were <b>all tall</b></li> </ul>
<p>What were the results of Mendel’s F<sub>1</sub> generation crosses?</p>	<ul style="list-style-type: none"> <li>• Some of the F<sub>2</sub> offspring were tall, and some were dwarf</li> <li>• The ratio was always 3 tall to 1 dwarf (3:1)</li> </ul>
<p>Mendel's findings</p> 	<ul style="list-style-type: none"> <li>• When Mendel crossed true-breeding plants with different traits, all of the F<sub>1</sub> plants showed only one trait (e.g., all tall); the F<sub>2</sub> plants showed a 3:1 ratio</li> <li>• He did not get “medium” plants!</li> <li>• He called the traits <b>dominant</b> (showed in F<sub>1</sub> generation) or <b>recessive</b> (didn’t show up in the F<sub>1</sub> generation)</li> </ul>

<p>Mendel's conclusions</p> 	<p>Mendel realized that:</p> <ol style="list-style-type: none"> <li>Inheritance of traits is controlled by genes contributed by each parent (e.g., flower color)</li> <li>These genes come in different forms, called alleles (e.g., purple or white flowers)</li> <li>Some alleles are dominant while others are recessive. <ul style="list-style-type: none"> <li>When both types of alleles are present, dominant alleles mask (cover up) recessive alleles.</li> </ul> </li> </ol>																														
<p>What is Mendel's Law of Dominance?</p>	<ul style="list-style-type: none"> <li>Generally, one allele is dominant to another</li> <li><b>Dominant</b> allele always expressed, even if combined with recessive allele <ul style="list-style-type: none"> <li>written as <b>uppercase</b> letter of the trait</li> <li>e.g., tall = dominant: TT, tT, or Tt</li> </ul> </li> <li><b>Recessive</b> allele expressed <b>only</b> if dominant allele is not present. <ul style="list-style-type: none"> <li>written as a <b>lowercase</b> letter of the dominant trait</li> <li>e.g., dwarf = recessive: tt</li> </ul> </li> </ul>																														
<p>What is <b>genotype</b>?</p>	<ul style="list-style-type: none"> <li><b>Genotype</b> = genetic combination of alleles (e.g., TT, Tt, tt)</li> </ul>																														
<p>What is <b>phenotype</b>?</p>	<ul style="list-style-type: none"> <li><b>Phenotype</b> = physical characteristic or trait (e.g., tall, short)</li> </ul>																														
<p>What is <b>homozygous</b>?</p>	<ul style="list-style-type: none"> <li><b>Homozygous</b> = both alleles are same (e.g., TT) -- "true breeding"</li> </ul>																														
<p>What is <b>heterozygous</b>?</p>	<ul style="list-style-type: none"> <li><b>Heterozygous</b> = alleles are different (e.g., Tt)</li> </ul>																														
<p>What is <b>hybrid</b>?</p>	<ul style="list-style-type: none"> <li><b>Hybrid</b> = offspring of crosses of parents with different traits (e.g., offspring of TT and tt)</li> </ul>																														
<p>What is Mendel's Law of Segregation?</p> <table border="1" data-bbox="138 1228 479 1648"> <tr> <td>Circle #</td> <td>1</td> <td>3</td> <td>7</td> <td>14</td> </tr> <tr> <td>Genotype:</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>Homozyg?</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>Phenotype:</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>Generat'n:</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>Gamete?</td> <td></td> <td></td> <td></td> <td></td> </tr> </table>	Circle #	1	3	7	14	Genotype:					Homozyg?					Phenotype:					Generat'n:					Gamete?					<ul style="list-style-type: none"> <li>When gametes form, the alleles from each parent are <u>segregated</u> (separated) from each other</li> <li>Each gamete carries only a single allele for each gene</li> </ul>

<p>What is Mendel's Law of Independent Assortment?</p>	<ul style="list-style-type: none"> <li>Genes for two different traits are inherited independently</li> <li>There is no connection between them (e.g., plant height and seed color)</li> </ul>																														
<p><b>Summary:</b></p>
